

McDonald's Reviews Dataset:

For our data set for this project, the unit of observation is McDonald's customers as each row represents a detailed customer review that describes their experience at McDonald's.

- *reviewer_id*: The *reviewer_id* variable is a unique identifier for each review to distinguish between different McDonald's customers.
 - It is important to note that our data contains 33,996 total reviews, each coming from a unique customer.
- *review*: The *review* variable is the textual context of the review detailing the customer's experience at McDonald's which highlights the reason for their satisfaction or dissatisfaction with their restaurant experience. This is where we will find common themes that come up when customers reflect on their experience.
 - Example: "The staff are very friendly and they do their job perfectly"
- *rating*: The *rating* variable is the numeric rating, on a one to five star scale, provided by the customer in conjunction with the review of their experience. This is how we will distinguish between positive and negative restaurant reviews.

...	count
rating	
5 stars	10274
1 star	9431
4 stars	5787
3 stars	4818
2 stars	3086
dtype:	int64

-
- *rating_number_only*: The *rating_number_only* variable is the transformation of the *rating* variable from a string to an integer.
 - For example, "5 stars" → 5
- *topic*: The *topic* variable represents the number correlating to each of the six different topic categories.
 - Example: 1 → "Fast and quick service, clean place, friendly staff"
- *topic_probability*: The *topic_probability* variable represents our model's estimated probability that a given review belongs to one of the six predetermined categories. Our model produces a distribution of probabilities across the different topics, and this column contains the highest probability which is connected to the topic in the *topic* and *topic_label* columns.
- *topic_label*: The *topic_label* is the content of the six different topic categories that we have assigned each review to.

...

	count
topic_label	
Bad service, wrong orders, rude staff	7060
Fast and quick service, clean place, friendly staff	6774
Overall good price, quality, service	6346
Long wait times, slow drive-thru	5009
Miscellaneous, general complains about environment	3514
Food quality issues (cold/old fries, burgers, nuggets)	3429

dtype: int64

-
- *sentiment*: The *sentiment* variable is where each review is assigned “positive” if given 4 or 5 stars, “negative” if given 1 or 2 stars, and “neutral” if given 3 stars.

...

	count
sentiment	
positive	15439
negative	12139
neutral	4554
